Week 10: Data Wrangling in Python

POP77001 Computer Programming for Social Scientists

Tom Paskhalis

14 November 2022

Module website: tinyurl.com/POP77001

Overview

- Numerical analysis in Python
- Tabular data
- Pandas object types
- Working with dataframes in pandas
- Data input and output

- As opposed to other programming languages (Julia, R, MatLab), Python provides very bare bones functionality for numeric analysis.
- E.g. no built-in matrix/array object type, limited mathematical and statistical functions

- As opposed to other programming languages (Julia, R, MatLab), Python provides very bare bones functionality for numeric analysis.
- E.g. no built-in matrix/array object type, limited mathematical and statistical functions

- As opposed to other programming languages (Julia, R, MatLab), Python provides very bare bones functionality for numeric analysis.
- E.g. no built-in matrix/array object type, limited mathematical and statistical functions

- As opposed to other programming languages (Julia, R, MatLab), Python provides very bare bones functionality for numeric analysis.
- E.g. no built-in matrix/array object type, limited mathematical and statistical functions

```
In [1]: # Representing 3x3 matrix with list
        mat = [[1, 2, 3],
               [4, 5, 6],
               [7, 8, 91]
In [2]: # Subsetting 3rd element of 2nd row
        mat[1][2]
Out[2]: 6
In [3]: # Naturally, this representation
        # quickly breaks down
        mat * 2
Out[3]: [[1, 2, 3], [4, 5, 6], [7, 8, 9], [1, 2, 3], [4, 5, 6], [7, 8,
         9]]
```

NumPy - numerical analysis in Python

- NumPy (Numeric Python) package provides the basis of numerical computing in Python:
 - multidimensional array
 - mathematical functions for arrays
 - array data I/O
 - linear algebra, RNG, FFT, ...

NumPy - numerical analysis in Python

- NumPy (Numeric Python) package provides the basis of numerical computing in Python:
 - multidimensional array
 - mathematical functions for arrays
 - array data I/O
 - linear algebra, RNG, FFT, ...

```
In [4]: # Using 'as' allows to avoid typing full name
# each time the module is referred to
import numpy as np
```

- Multidimensional (N) array object (aka ndarray) is a principal container for datasets in Python.
- It is the backbone of data frames, operating behind the scenes

- Multidimensional (N) array object (aka ndarray) is a principal container for datasets in Python.
- It is the backbone of data frames, operating behind the scenes

- Multidimensional (N) array object (aka ndarray) is a principal container for datasets in Python.

                 [7, 8, 9]])
```

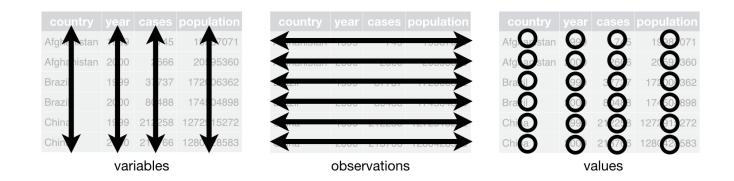

Array indexing and slicing

Expression	Shape
arr[:2,1:]	(2,2)
arr[2]	(3,)
arr[2, :]	(3,)
arr[2:, :]	(1,3)
arr[:, :2]	(3,2)
arr[1, :2]	(2,)
arr[1:2, :2]	(1,2)

Source: Python for Data Analysis

Tidy data

- Tidy data is a specific subset of rectangular data, where:
 - Each variable is in a column
 - Each observation is in a row
 - Each value is in a cell

Source: R for Data Science

Pandas

- Standard Python library does not have data type for rectangular data
- However, pandas library has become the de facto standard for data manipulation
- pandas is built upon (and often used in conjuction with) other computational libraries
- E.g. numpy (array data type), scipy (linear algebra) and scikit-learn (machine learning)

Pandas

- Standard Python library does not have data type for rectangular data
- However, pandas library has become the de facto standard for data manipulation
- pandas is built upon (and often used in conjuction with) other computational libraries
- E.g. numpy (array data type), scipy (linear algebra) and scikit-learn (machine learning)

In [1]: import pandas as pd # Using 'as' allows to avoid typing full name each

Core pandas object types

- Series one-dimensional sequence of values
- DataFrame (typically) two-dimensional rectangular table

```
In [2]: sr1 = pd.Series([150.0, 120.0, 3000.0])
        sr1
               150.0
Out[2]:
               120.0
              3000.0
         dtype: float64
In [3]:
        sr1[0] # Slicing is similar to standard Python objects
         150.0
Out[3]:
In [4]:
        sr1[sr1 > 200] # But subsetting is also available
              3000.0
Out[4]:
         dtype: float64
```

• Another way to think about Series is as a ordered dictionary

• Another way to think about Series is as a ordered dictionary

```
In [5]: d = {'apple': 150.0, 'banana': 120.0, 'watermelon': 3000.0}
```

Another way to think about Series is as a ordered dictionary

Another way to think about Series is as a ordered dictionary

```
In [5]: d = {'apple': 150.0, 'banana': 120.0, 'watermelon': 3000.0}
In [6]:
        sr2 = pd.Series(d)
        sr2
         apple
                        150.0
Out[6]:
         banana
                        120.0
                       3000.0
         watermelon
         dtype: float64
In [7]:
        sr2[0] # Recall that this slicing would be impossible for standard dict
         150.0
Out[7]:
```

Another way to think about Series is as a ordered dictionary

```
In [5]: d = {'apple': 150.0, 'banana': 120.0, 'watermelon': 3000.0}
In [6]:

        sr2[0] # Recall that this slicing would be impossible for standard dict
         150.0
Out[7]:
In [8]:
        sr2.index # Sequence of labels is converted into an Index object
Out[8]: Index(['apple', 'banana', 'watermelon'], dtype='object')
```

DataFrame - the workhorse of data analysis

• DataFrame is a rectangular table of data

DataFrame - the workhorse of data analysis

• DataFrame is a rectangular table of data

Out[9]:		fruit	weight	berry
	0	apple	150.0	False
	1	banana	120.0	True
	2	watermelon	3000.0	True

Indexing in DataFrame

- DataFrame has both row and column indices
- DataFrame.loc() provides method for *label* location
- DataFrame.iloc() provides method for *index* location

Indexing in DataFrame

- DataFrame has both row and column indices
- DataFrame.loc() provides method for *label* location
- DataFrame.iloc() provides method for *index* location

```
In [10]: df.iloc[0] # First row

Out[10]: fruit apple weight 150.0 berry False Name: 0, dtype: object
```

Indexing in DataFrame

- DataFrame has both row and column indices
- DataFrame.loc() provides method for *label* location
- DataFrame.iloc() provides method for *index* location

```
In [10]: df.iloc[0] # First row

Out[10]: fruit apple weight 150.0 berry False Name: 0, dtype: object

In [11]: df.iloc[:,0] # First column

Out[11]: 0 apple 1 banana 2 watermelon Name: fruit, dtype: object
```

Summary of indexing in DataFrame

Expression	Selection Operation
df[val]	Column or sequence of columns +convenience (e.g. slice)
df.loc[lab_i]	Row or subset of rows by label
<pre>df.loc[:, lab_j]</pre>	Column or subset of columns by label
<pre>df.loc[lab_i, lab_j]</pre>	Both rows and columns by label
<pre>df.iloc[i]</pre>	Row or subset of rows by integer position
<pre>df.iloc[:, j]</pre>	Column or subset of columns by integer position
<pre>df.iloc[i, j]</pre>	Both rows and columns by integer position
<pre>df.at[lab_i, lab_j]</pre>	Single scalar value by row and column label
<pre>df.iat[i, j]</pre>	Single scalar value by row and column integer position

Extra: Pandas documentation on indexing

```
In [12]: df.iloc[:2] # Select the first two rows (with convenience shortcut for
              fruit weight berry
Out[12]:
              apple
                    150.0
                           False
            banana 120.0 True

File object

- File object in Python provides the main interface to external files
- In contrast to other core types, file objects are created not with a literal,
- But with a function, open():

<variable_name> = open(<filepath>, <mode>)

Data input and output

- Modes of file objects allow to:
 - (r)ead a file (default)
 - (w)rite an object to a file
 - e(x)clusively create, failing if a file exists
 - (a)ppend to a file
- You can r+ mode if you need to read and write to file

```
In [33]: f = open('../temp/test.txt', 'w') # Create a new file object in write n
```

```
In [33]: f = open('../temp/test.txt', 'w') # Create a new file object in write n
In [34]: f.write('This is a test file.') # Write a string of characters to it
Out[34]: 20
```

```
In [33]: f = open('../temp/test.txt', 'w') # Create a new file object in write n
In [34]: f.write('This is a test file.') # Write a string of characters to it
Out[34]: 20
In [35]: f.close() # Flush output buffers to disk and close the connection
```

Data input example

• To avoid keeping track of open file connections, with statement can be used

Extra: Python documentation on with statement

Data input example

• To avoid keeping track of open file connections, with statement can be used

Extra: Python documentation on with statement

```
In [36]:
with open('../temp/test.txt', 'r') as f: # Note that we use 'r' mode for
text = f.read()
```

Data input example

• To avoid keeping track of open file connections, with statement can be used

Extra: Python documentation on with statement

```
In [36]: with open('../temp/test.txt', 'r') as f: # Note that we use 'r' mode for
    text = f.read()

In [37]: text
Out[37]: 'This is a test file.'
```

Reading and writing data in **pandas**

- pandas provides high-level methods that takes care of file connections
- These methods all follow the same read_<format> and to_<format> name patterns
- CSV (comma-separated value) files are the standard of interoperability

```
<variable_name> = pd.read_<format>(<filepath>)

<variable_name>.to_<format>(<filepath>)
```

Reading data in **pandas** example

- We will use the data from Kaggle 2021 Machine Learning and Data Science Survey
- For more information you can read the executive summary
- Or explore the winning Python Jupyter Notebooks

Reading data in **pandas** example

Reading in other (non- .csv) data files

- Pandas can read in file other than .csv (comma-separated value)
- Common cases include STATA .dta, SPSS .sav and SAS .sas
- Use pd.read_stata(path), pd.read_spss(path) and pd.read_sas(path)
- Check here for more examples

Writing data out in Python

- Note that when writing data out we start with the object name storing the dataset
- I.e. df.to_csv(path) as opposed to df = pd.read_csv(path)
- Pandas can also write out into other data formats
- E.g. df.to_excel(path), df.to_stata(path)

Writing data out in Python

- Note that when writing data out we start with the object name storing the dataset
- I.e. df.to_csv(path) as opposed to df = pd.read_csv(path)
- Pandas can also write out into other data formats
- E.g. df.to_excel(path), df.to_stata(path)

```
In [41]: kaggle2021.to_csv('../temp/kaggle2021.csv')
```

Summarizing numeric variables

Summary of descriptive statistics methods

Method	Numeric	Categorical	Description
count	yes	yes	Number of non-NA observations
value_counts	yes	yes	Number of unique observations by value
describe	yes	yes	Set of summary statistics for Series/DataFrame
min, max	yes	yes (caution)	Minimum and maximum values
quantile	yes	no	Sample quantile ranging from 0 to 1
sum	yes	yes (caution)	Sum of values
prod	yes	no	Product of values
mean	yes	no	Mean
median	yes	no	Median (50% quantile)
var	yes	no	Sample variance
std	yes	no	Sample standard deviation
skew	yes	no	Sample skewness (third moment)
kurt	yes	no	Sample kurtosis (fourth moment)
